

Introduction

The statistical information appeared in this chapter is presented in three sections: Geographical characteristics and administrative divisions, Climate, and Environment.

1. Geographical characteristics and administrative divisions

Iran comprises a land area of over 1.6 million square kilometres. It lies down the northern temperate zone, between latitudes 25° 00' north and 39° 47' north and between longitudes 44° 02' east and 63° 20' east. The land's average height is over 1200 metres. The lowest place, located in Chaleh-ye-Loot is only 56 metres high, while the highest point, Damavand peak in Alborz mountains, rises as high as 5610 metres. The land height at the southern coastal strip of the Caspian Sea is 28 metres lower than the open seas.

Iran is bounded by Turkmenistan, Caspian Sea, Azerbaijan, and Armenia on the north, Afghanistan and Pakistan on the east, Oman Sea and Persian Gulf on the south, and Iraq and Turkey on the west.

Administratively, the country is divided into Ostans, Ostans into Shahrestans, and Shahrestans into cities and Dehestans.

Highlands of Iran can be divided into four mountain ranges: northern, western, southern and central and eastern ranges. The northern mountains have extended from Ararat Mountain in Turkey to Hindu Kush Mountain in Afghanistan, including Alamdar, Sahand, Sabalan, Talesh, Qaflan Kuh mountains in Azarbeyjan, Albourz mountain ranges at the north of Tehran and south of Mazandaran and

Gilan Ostans, Ala Dagh, Binalud, Hezar Masjed and Qarah Dagh in Khorasan Ostan on the east of Iran.

The mountains in the east which have extended from Ararat Mountain to the north west and the south east of the country covering Sari Dash, Chehel Cheshmeh, Panjeh Ali, Alvand, Bakhtiyari mountains, Pish Kuh, Posht Kuh, Oshtoran Kuh and Zard Kuh, form Zagros ranges . The highest peak of this range is "Dena" with a 4409 m height.

Southern mountains range stretches from Khzestan province to Sistan & Baluchestan province and joins Soleyman mountains in Pakistan. The mountain range includes Sepidar, Meymand, Bashagard and Bam Posht mountains. Central and eastern mountains mainly comprise Karkas, Shir Kuh, Kuh Banan, Jebal Barez, Hezar, Bazman and Taftan , the highest of which is Hezar mountain with a 4465 m height.

The largest Iranian islands are mainly located at Persian Gulf and Hormuz Strait. They are: Qeshm, Kish, Lavan, Larak Shahri, Hormuz, Hengam Jadi (new Hengam), Kabudan, Ashk (Orumiye Lake), Faroor Bozorg (Great Faroor), Hendurabi, Khark, Minou, Siri, Khan, Abu Mosa, Espir (Orumiye Lake), Tonb Bozorg (Great Tonb), Morghi, Kharku, Arezoo, (Orumiye Lake), Faroor Kuchak(Small Faroor) and Tunb Kuchak (Small Tonb).

The Caspian Sea (the world's largest lake) lies on the north of Iran and connects Iran to European countries through Russian water ways. The water of the most Iranian lakes is salty. The major internal lakes are: Orumiye, Namak, Hamoun Jazmourian, Hamoun Saberi,

Bakhtegan, Toshak, Hamoun Pouzak, Maharlou, Hamoun Hirmand, Talab Anzali (Anzali lagoon), Howz-e-Sultan, Parishan and Zarivar of Marivan.

2. Climate

Due to its vast area, abundant mountains, desert lands and being adjacent to two large seas at the north and south as well as its closeness to Europe, Mediterranean Sea, African large Sahara desert, Indian Ocean, Asian internal highlands and large cold areas, Iran enjoys a variable climate. The effect of distance from the sea, namely closeness and remoteness from sea, can be easily perceived by comparing the large amount of rainfall and rich vegetation and highly populated areas around the Caspian Sea with uninhabited arid deserts in the centre of Iran. The continuation of the mountain ranges, their location opposite or parallel the winds direction and air flows are among the factors which always affect climate change. There is a significant difference among slopes facing or backing onto humid winds in terms of rainfall amount and vegetation.

The country generally features three climatic zones:

1. Arid and semi-arid regions of the interior and far south characterized by long, warm and dry periods, lasting some years over 7 months. The annual precipitation in such regions varies between 30 to 250 mm.

2. Mountainous extensions, which are sub-divided into cold and moderate mountainous regions.

2.1. Cold mountainous regions: about 40000 sq km of the total country consists of major highlands, including Alborz and Zagross mountain ranges, as well as Sahand and Sabalan high peaks. The annual precipitation in these

regions exceeds 500 mm.

2.2. Moderate mountainous regions:

some 300000 sq km of the country enjoys moderate mountainous climate, where the annual

precipitation varies from 250 to 600 mm.

3. Caspian region, which is a narrow strip with a limited extension, trapped between the Caspian Sea and Alborz mountains with as much as 600 to 2000 mm precipitation per annum.

Measurement of climatic characteristics, which dates back to 1320, is currently performed by the National Meteorological Organization at its numerous synoptic stations scattered around the country. The data in this chapter, however, are only from those located in Ostan (provincial) centres. They include temperature, precipitation, and relative humidity, the number of frosty days, hours of bright sunshine and speed of wind.

Notes:

1. Some capitals of Ostans have several synoptic stations and the data appeared here are from those located at the airports of Ostan's capitals.
2. Central basins, Hamun and Sarakhs, were renamed Central Plateau, Eastern Border and Qareh Qum respectively in 1383.

3. Environment

Statistics for types of natural resources, natural monuments protected by Iran Department of Environment have been reflected in the Iranian statistical yearbook since 1368.

Definitions and concepts

Shahrestan (subprovince): an administrative division with a certain geographical boundary, formed from joining of a few neighbouring Bakhshes which enjoy homogeneous natural, social, economic, political and cultural conditions.

Bakhsh (county): an administrative division with a specific geographical boundary, including a number of neighbouring Dehestans and their adjacent fields, places, Roostas (hamlets), and possibly Shahrs, which are similar in natural, social, cultural, economic and political aspects.

Shahr (city/town): an area with a legal boundary, located within the geographical boundary of a certain Bakhsh and in terms of constructional context, employment and other factors, having the distinctive features of a city.

Dehestan (rural agglomeration): the smallest unit among administrative divisions with a specific geographical boundary, comprised of a number of neighbouring Roostas and their adjacent places and fields, homogeneous in environment, economic and social conditions that allow for providing public services and planning within a single system and network.

Synoptic stations (simultaneous meteorological reporting stations): the stations at which various climatic features including dry and humid temperatures, amount and type of cloud, amount of precipitation, type of climatic phenomenon, direction and speed of wind, amount of evaporation, air pressure, hours of bright sunshine, changes in pressure, amount of solar radiation, etc. are according to certain instructions at certain hours measured and by devices like SSB, telephone or telex communicated to meteorological centres across the globe after being registered.

Absolute minimum: the lowest temperature during a certain period (24 hours, one month, one year, or a few years).

Absolute maximum: the highest temperature during a certain period (24 hours, one month, one year, or a few years).

Relative humidity: the amount of humid air in a

volume unit of air.

Average height of precipitation: the weighted mean of an area, measured by dividing the area into several polygons and calculating the mean from the precipitation over each polygon.

Water basin: is a geographical area in which overland flows from rain and melting snow or ice drains downhill into a body of water, such as ocean, sea, lake, wetland or flat. If the concentration point is located inside the basin, the basin is a closed one (e.g. Orumiyeh Lake), but if the point is located at the end of the basin, so that the flow can leave there, then there is an open basin. Every given point in a river is considered the concentration point for the basin just above it.

Aquatic year: from the first day of Mehr to the end of Shahrivar of the next year.

Coefficient of overland flow: the ratio of the volume of water flowed in a given hydrometric station to the volume of the precipitation of the basin stretching to the station.

Hydrometric stations: stations in which parameters of debit (discharge), sediment, temperature, physical properties of water and features of ice cover and chemical properties of rivers, lake and reservoir water are observed and measured.

Volume of overland flow: To estimate the volume of overland flow of each of the country's main basins, a total of 42 rivers have been selected to indicate and represent the overall overland flow. The total volume of overland flow of the group exceeds 60 percent of the country's grand total. To reach the volume of any individual flow, a proper coefficient is applied to the total volume.

National parks: an area of the nation's natural resources such as jungles, pastures, natural

coppices, woodlands, plains, water and mountainous regions which presents distinguished samples of Iran's natural manifestations and is protected in order to provide sustainable preservation of its natural and distribution conditions and create a suitable environment for reproduction and breeding of wildlife and growth of plants in a completely natural condition.

Wildlife habitats: an area of the nation's natural resources such as jungles, pastures, natural coppices, woodlands, plains, water and mountainous regions which has typical natural habitats and special ecological conditions for wildlife and is protected in order to preserve or rehabilitate these protected habitats.

Nature reserves: protected areas of the country's nature, including jungles, pastures, plains, or mountainous regions which are habitat for important or rare species of wildlife and/or plantation.

National natural heritages: specific and rare species of plants or animal and unique picturesque settings or views, specific natural forms of the earth as well as very old trees which are protected while considering an appropriate limit.

Selected information

The total length of the I.R. Iran's borderlines is 8865 kilometers out of which the longest borderline is for that of Iran-Iraq and the shortest one goes to Iran-Armenia which equals 1609 and 48 kilometers respectively.

In 1388, Sistan & Baluchestan, Kerman, Yazd, Fars, Khorasan-e- Razavi and Esfahan were among the largest provinces in the country respectively, and each of them has an area of more than 100000 Km². Tehran as the capital

city of Iran with an area of 19000 Km² ranks as the nation's 24th largest province.

In 1388, I.R.Iran was divided into 30 Ostans (provinces), 380 Shahrestans (sub-provinces), 945 Bakhshes (counties), 1105 Shahrs (cities) and 2459 Dehestans (rural agglomerations). Moreover, average maximum and minimum temperatures in Ostans' centers belong to Bandar Abbas, Ahvaz with 27.5° C and Ardebil with 10.5° C respectively. Furthermore, the absolute maximum belongs to Ahvaz with 49.6° C and the absolute minimum goes to Ardebil with -16.4° C. Also in the said year, the highest annual precipitation of the country belongs to Rasht and Sari which amounted to 1078.6 and 955.3 mm respectively and Yazd and Kerman with 45.2 and 77.5 mm respectively had the lowest annual precipitation amongst all Ostans' centers. The maximum frosty days belong to Shahr-e-Kord with 138 days and Ardebil with 95 days. Bandar Abbas, Bushehr and Ahvaz have not experienced any frosty day.

The volume of precipitation in national main basins during the aquatic year of 1387-88 was approximately 352 bln m³ out of which the share of each basin is: the Caspian Sea 75.3 bln m³, the Persian Gulf and Oman Sea 107.9 bln m³, the Lake Orumiyyeh 15.5 bln m³, Central Plateau 128.8 bln m³, Eastern Border 13.7 bln m³ & Qareh Qum 11.2 bln m³.

It is also noteworthy that the ratio of the area of main water basins to the total country area is: the Caspian Sea 11%, the Persian Gulf and Oman Sea 26%, Lake Orumiyyeh 3%, Central Plateau 51%, Eastern Border 6 % & Qareh Qum 3%.
