

### *Introduction*

The statistical information that appeared in this chapter includes “geographical characteristics and administrative divisions”, and “climate”.

#### *1. Geographical characteristics and administrative divisions*

Iran comprises a land area of over 1.6 million square kilometers. It lies down on the southern half of the northern temperate zone, between latitudes 25° 04' and 39° 46' north, and longitudes 44° 02' and 63° 19' east. The land's average height is over 1200 meters above sea level. The lowest place, located in Chaleh-ye-Loot, is only 56 meters high, while the highest point, Damavand peak in Alborz Mountains, rises as high as 5610 meters. The land height at the southern coastal strip of the Caspian Sea is 28 meters lower than the open sea.

Iran is bounded by Turkmenistan, the Caspian Sea, Republic of Azerbaijan, and Armenia on the north, Afghanistan and Pakistan on the east, Oman Sea and the Persian Gulf on the south, and Iraq and Turkey on the west

Administratively, the country is divided into Ostans, Ostans into Shahrestans, and Shahrestans into some Shahrs and Dehestans.

Highlands of Iran can be divided into four mountain ranges: northern, western, southern and central and eastern ranges. The northern mountain ranges have extended from Ararat Mountain in Turkey to Hindu Kush Mountain in Afghanistan, including Alamdar,

Sahand, Sabalan, Talesh, Qafan Kuh mountains in Azarbayejan, Alborz mountain ranges at the north of Tehran and south of Mazandaran and Gilan Ostans, Ala Dagh, Binalud, Hezar Masjed and Qarah Dagh in Khorasan Ostan on the east of Iran and joins Hindu Kush mountains in Afghanistan.

The mountain ranges in the west, which have extended from Ararat mountain to the north west and the south east of the country, cover Sari Dash, Chehel Cheshmeh, Panjeh Ali, Alvand, Bakhtiyari mountains, Pish Kuh, Posht Kuh, Oshtoran Kuh and Zard Kuh which totally form Zagros ranges. The highest peak of this range is “Dena” with a 4409 meters height.

The southern mountain range stretches from Khouzestan Ostan to Sistan & Baluchestan Ostan and joins Soleyman Mountains in Pakistan. The mountain range includes Sepidar, Meymand, Bashagard and Bam Posht Mountains.

Central and eastern mountains mainly comprise Karkas, Shir Kuh, Kuh Banan, Jebal Barez, Hezar, Bazman and Taftan mountains, the highest of which is Hezar Mountain with a 4465 m height.

The largest Iranian islands that are mainly located at Persian Gulf and Hormuz Strait, are Qeshm, Kish, Lavan, Larak Shahri, Hormuz, Hengam Jadid (new Hengam), Kabudan, Ashk (Orumiyeh Lake), Faroor Bozorg (Greater Faroor), Hendurabi, Khark, Minou, Siri, Khan, Abu Mosa, Espir (Orumiyeh Lake), Tonb Bozorg (Greater Tonb), Morghi,

Kharku, Arezoo (Orumiyeh Lake), Faroor Kuchak (Small/Lesser Faroor) and Tonb Kuchak (Small/Lesser Tonb).

The Caspian Sea (the world's largest lake) lies on the north of Iran and connects Iran to European countries through Russian waterways. The water of the most of the Iranian lakes is salty. The major internal lakes are: Orumiyeh, Namak, Hamoun Jazmourian, Hamoun-e-Saberi, Bakhtegan, Toshak, Hamoun-e-Pouzak, Maharlu, Hamoun-e-Hirmand, Talab-e-Anzali (Anzali lagoon), Howz-e-Sultan, Parishan and Zarivar of Marivan.

## 2. Climate

Due to its vast area, abundant mountains, desert lands and being adjacent to two large seas at the north and south as well as its closeness to Europe, Mediterranean Sea, African large Sahara desert, Indian Ocean, Asian internal highlands and large cold areas, Iran enjoys a very diverse climate. The effect of distance from the sea, namely closeness and remoteness from the sea, can be easily perceived by comparing the large amount of rainfall and rich vegetation and highly populated areas around the Caspian Sea with the uninhabited arid deserts in the centre of Iran. The continuation of the mountain ranges, their location opposite or parallel to the winds direction and air flows are among the factors, which always affect climate change. There is a significant difference among the slopes facing or backing onto humid winds in terms of rainfall amount and vegetation.

The country generally features three climatic zones:

**1. Arid and semi-arid climate:** Vast regions of the interior and far south of Iran enjoy this climate which are characterized by long, warm and dry periods, some years lasting over 7 months. The

annual precipitation in such regions varies from 30 to 250 mm.

**2. Mountainous climate:** which are sub-divided into cold and moderate mountainous climate.

2.1. Cold mountainous climate: about 40000 sq km of the total country consists of major highlands, including Alborz and Zagross mountain ranges, as well as Sahand and Sabalan high peaks. The annual precipitation in these regions exceeds 500 mm.

2.2. Moderate mountainous climate: some 300000 sq km of the country enjoys a moderate mountainous climate, where the annual precipitation varies from 250 to 600 mm.

**3. Caspian climate:** which is a narrow strip with a limited extension, trapped between the Caspian Sea and Alborz mountains range with as much as 600 to 2000 mm precipitation per year..

Measurement of climatic characteristics, which dates back to the year 1320, is currently performed by the National Meteorological Organization at its numerous synoptic stations scattered around the country. The data in this chapter, however, are only from those located in Ostan (provincial) centres. They include temperature, precipitation, and relative humidity, the number of frosty days, hours of bright sunshine, and speed of the wind.

### Notes:

1. Some capitals of Ostans have several synoptic stations and the data appeared here are from those located at the airports of Ostan's capitals.

2. Central basins, Hamun and Sarakhs, were renamed Central Plateau, Eastern Border, and Qareh Qum basins, respectively in the year 1383.

The Statistics in this Chapter have been gathered from the Armed Forces Geographical Organization, Ministry of the Interior, I.R. of Iran Meteorological

Organization and Iran Water Resource Management Company. It is necessary to mention that the provided statistics were produced by register-based method.

### ***Definitions and concepts***

***Shahrestan (subprovince):*** an administrative division with a certain geographical boundary, formed from joining of a few neighboring Bakhshes (county) which enjoy the homogeneous natural, social, economic, political and cultural conditions.

***Bakhsh (county):*** an administrative division with a specific geographical boundary, including a number of neighboring Dehestans and their adjacent fields, places, Roostas (hamlets), and possibly Shahrs (cities), which are similar in natural, social, cultural, economic and political aspects.

***Shahr (city/town):*** Each of regions according to the approval of the Cabinet is known as a city and has a municipality.

***Dehestan (rural agglomeration):*** the smallest unit among administrative divisions with a specific geographical boundary, comprised of a number of neighboring Roostas and their adjacent places and fields, homogeneous in environment, economic and social conditions that allow for providing public services and planning within a single system and network.

***Synoptic stations (simultaneous meteorological reporting stations):*** These are stations at which, various climatic features including dry and humid temperatures, amount and type of cloud, amount of precipitation, type of climatic phenomenon, direction and speed of wind, amount of evaporation, air pressure, hours of bright sunshine, changes in pressure, amount of solar radiation, etc. are

according to certain instructions at certain hours measured and communicated to meteorological centers across the globe by devices like SSB, telephone or telex after being registered.

***Absolute minimum:*** the lowest temperature during a certain period (24 hours, one month, one year, or a few years).

***Absolute maximum:*** the highest temperature during a certain period (24 hours, one month, one year, or a few years).

***Relative humidity:*** the amount of humid air in a volume unit of air.

***Sunshine hours:*** According to the World Meteorological Organization (WMO), the sunshine hour refers to the sunshine as the time during which the direct solar radiation exceeds the level of 120 W/m<sup>2</sup>.

***The average height of precipitation:*** is the weighted mean of an area. By dividing the area into several polygons and considering the precipitation in each polygon, the average height of precipitation is calculated.

***Water basin:*** This is an area over which surface run-off flows via a specific route and, is collected into an outlet.

***Aquatic year:*** It refers to the measurement of the precipitation in a twelve-month period for a specific area which starts from the first day of the month of Mehr to the end of the month of Shahrivar of the next year in Iran.

***Coefficient of overland flow:*** the ratio of the volume of water flowed in a given hydrometric station to the volume of the precipitation of the basin stretching to the station.

***Hydrometric stations:*** They refer to the stations located in the rivers, lake, river mouth and dams

reservoir in which quantitative and qualitative data on water are collected and recorded.

**Volume of overland flow:** To estimate the volume of overland flow of each of the country's main basins, a total of 42 rivers have been selected to indicate and represent the overland flow whose annual total volume exceeds 60 percent of the country's grand total. To reach the volume of any individual flow, a proper coefficient is applied to the total volume.

#### *Selected information*

The total length of the Iran's borderlines is 8640 kilometers out of which the longest borderline is for that of south waters with 2106 kilometers and the shortest one goes to Iran-Armenia which equals 45 kilometers.

In the year 1399, Sistan & Baluchestan, Kerman, South Khorasan, Fars, Khorasan-e-Razavi and Esfahan were among the largest Ostans in the country, respectively, and each of them has an area of more than 100000 Km<sup>2</sup>. Tehran Ostan with an area of about 13.6 thousand Km<sup>2</sup> ranks the 29<sup>th</sup> among the nation's Ostans.

In the year 1399, Iran has 31 Ostans (provinces), 457 Shahrestans (sub-provinces), 1126 Bakhshes (counties), 1395 Shahrs (cities) and 2674 Dehestans (rural agglomerations).

In the year 1399, the highest and lowest average temperatures in Ostans' centers are for Bandar Abbas with 27.3°C and Ardebil with 10.3°C, respectively. Furthermore, Ahvaz with 51.5 °C and Ardabil with -20.8 °C have the highest maximum and the lowest minimum temperature among the capitals of the Ostans, respectively.. Also in the mentioned year, the highest annual precipitation of the country belongs to Rasht and Yasuj, which amounted to 1296.2 and 907.2 mm, respectively, and Yazd and Kerman with 50 and 51.3 mm, respectively had the lowest annual precipitation amongst all Ostans' capitals. In the year 1399, the maximum frosty days go to Shahr-e-Kord with 71 days, Hamedan with 58 days, and Zanzan with 52 days; and Ahvaz, Bandar Abbas, and Bushehr experienced no frosty day.

The volume of precipitation in national main basins during the aquatic year of 1398-99 was approximately 515.609 billion m<sup>3</sup> out of which the share of each basin is as follows: the Caspian Sea, 86.095 billion m<sup>3</sup>, the Persian Gulf and Oman Sea, 190.686 billion m<sup>3</sup>, the Lake of Orumiyeh, 18.950 billion m<sup>3</sup>, Central Plateau, 191.722 billion m<sup>3</sup>, Eastern Border, 15.333 billion m<sup>3</sup> & Qareh Qum, 12.921 billion m<sup>3</sup>.
