

T

Introduction

The statistics appearing in this chapter have been provided as register records by the Ministry of Energy on two topics of "water" and "electricity".

Water

This section includes information on "underground waters", "reservoir dams", and "length of networks and number of water and sewage extensions". The related statistics have been added to the Statistical Yearbook of Iran since the year 1346.

Statistics on underground waters and reservoir dams have been provided by the Water Resources Management Company and statistics on the length of networks and the number of water and sewage extensions has been obtained from the Water and Sewage Engineering Company.

It is noteworthy that the Central and Internal basin, Hamun basin, and Sarakhs basin were renamed by the Water Resources Management Organization as Central Plateau, Eastern Border and Qareh Qum, respectively, in the year .

Electricity

Data related to the electric power industry was first collected in the year 1343 by the then Ministry of Water and Power (renamed the Ministry of Energy in the year 1353). Since the year 1346, the Ministry has regularly provided the annual statistics on the power industry comprising power generation, transmission, distribution, and consumption. The statistics, a part of which appears in some tables of this yearbook, is presented in various annual.

Moreover, through two successive censuses of population and housing in the years 1365 and 1375, the Statistical Centre of Iran collected data on residential units and households benefiting from piped water and electricity, which are reflected in Chapter 10, "Construction and Housing," of the yearbook.

Definitions and concepts

Water basin: See Chapter 1, Land and climate, Definitions and concepts.

Aquatic year: See Chapter 1, Land and climate, Definitions and concepts.

Water produced: This refers to the amount of water gained from various (surface and underground) water resources such as wells, springs, subterranean canals, dams and river basins.

Dam: See Definition and concepts Chapter five (Agriculture, Forestry, and Fisheries)

Reservoir dam: This is a dam constructed for water storage, managing or controlling the flow of water to meet different needs including irrigation (agriculture), drinking, industry, electricity generation and control of flood.

Large reservoir dam: This refers to all dams with a height of 15 metres or more as well as 10 to 15 metres high, but having a reservoir with a volume of 1 million cubic or more metres and/or a capacity of flood discharge of 2000 or more cubic metres per second.

Inflow: This refers to the volume of water entering the reservoir of a dam through the river during a given time period.

Outflow: This refers to the total volume of water discharged from different outlets of a dam (weir, silt ejector channels, take-out gates, drainage channels) and evaporation during a given time period..

Water extension: This refers to the part of branched-off water pipes, containing pipe, and related accessories, with a profile appropriate to the water meter and the extension capacity of public water, which connects a private water distribution line or public water distribution network from the installation place of the extension valve to the delivery point (valve following the water meter).

Public water distribution network: This refers to a collection of interconnected pipelines to distribute water to the consumers from production or reserving points.

Nominal capacity (registered nominal power): The nominal power of a turbine or generator refers to the maximum expected output of an electricity generator in designing conditions defined by the manufacturer. Nominal power is usually installed in KVA or KW for smaller generators on the generator.

Actual capacity or actual power (registered power): This refers to the maximum amount of

electricity that could be generated by a generator while considering the environmental conditions (altitude, temperature, and relative moisture).

Maximum coincidental power generated: This refers to the sum of electric power generated at the peak of network load during a given time period. The sum of the maximum coincidental power generated might be equal to or less than the total capacity of the plants.

Gross electricity generation of power plants: This refers to the sum of electricity generated by the generators of a power plant, which is measured in kilowatt hours or megawatt hours at the output terminal of the generators during a given period of time.

Net electricity generation of power plants: This refers to the amount of gross generation minus the internal energy consumed in a given time period by kilowatt-hour (kWh) or megawatt-hour (MWh).

Other institutions: They refer to the institutions generate electricity for their own consumption, but are not affiliated with the Ministry of Energy, and may sell a part of their production to other institutions.

National grid: It refers to a network including all power generation points and electricity consumption regions in the nation, which are connected to each other by power transmission lines and stations, where energy exchange takes place.

Isolated grid (generation and power consumption): It refers to a set of generation and consumption sites which is connected to each other, but not connected to the national grid, and cannot exchange energy with the national grid.

Load-demand: It refers to the power consumed during a given time period in certain point of the network.

Maximum coincidental load consumed: It refers to the maximum coincidental load for a day, a week, a month, or a year out of the sum of load at the peak of consumption in regions in megawatt. If the interconnected system does not cover the total country, the maximum coincidental load may be calculated by adding up the maximum load of the interconnected network and load of separate regions in megawatt simultaneously.

Maximum non-coincidental load consumed: It refers to the sum of the peak of consumption in different areas of the intended region during a given time period, which is not necessarily simultaneous.

Regional power company: It refers to the corporation engaged in the provision, transmission, and distribution of electricity in the field of its activities.

Power plant: It refers to the installation place of generators and related equipment.

Hydroelectric power plant: It refers to a power plant in which the potential energy of water accumulated at dams or flowing energy of rivers water is used for electricity generation.

Thermal power plant: It refers to a power plant in which the energy inherent in solid, liquid, gaseous fuels is used for steam or hot gas (smoke) production and then driving the steam turbine to generate electricity.

Steam power plant: It refers to a thermal power plant in which thermal energy from liquid, solid and gaseous fuels is used for steam production and generating electricity.

Gas power plant: This refers to a power plant in which the thermal energy from gas and liquid fossil fuels is used to produce hot gas (smoke) and in a gas turbine to generate electricity.

Combined-cycle power plant: This refers to a power plant in which, in addition to electric energy produced in gas turbines, the heat in gases coming off the gas turbine is used for the production of steam using a recycling steam kettle. The steam produced is transformed into electric energy in a steam turbo-generator set.

Diesel power plant: This refers to a power plant in which gas oil is used to operate a diesel engine, and mechanical energy produced by a coupled generator with it is turned into electric energy.

Internal consumption: This refers to the sum of electricity consumed internally by units and for non-technical cases, as well as consumption of the lights, etc. in a power plant in a given time period.

Losses: This refers to the energy lost in the transmission of energy from the producer to the consumer.

Sale or consumption of electricity: This refers to the amount of electricity sold to domestic

consumers based on the determined tariffs by the Ministry of Power.

Energy produced by the fuel (thermal value): This refers to the amount of heat (kilocalorie or B.T.U.) produced through the burning of the mass unit of a certain fuel.

Thermal output: This refers to the ratio of thermal energy produced by 1 kWh to the thermal value of the consumed fuel.

Line of power: This refers to a set of circuits installed on bases to transmit the electric power produced from the generation site (power plant) or substation to consumption places in different voltages.

Power transmission line: This refers to a set of conductors, insulators and other peripheral equipment used to transmit high amounts of electricity with very high voltage (230 and 400 kV) in long routes between the source points (power plants or substations) and its receivers.

Sub-transmission line: This refers to a set of conductors, insulators and other peripheral equipment used to transmit high amounts of electricity with very high voltage (66 and 132 kV) in long routes between the source points (power plants or substations) and its receivers.

Electricity customers: They refer to legal or natural people whose request for enjoying power connection service(s) is met according to the by-laws of the electricity company and connection number is assigned to them.

Household uses of power energy: This refers to the amount of electricity that is used to operate common electric appliances and for lighting in residential units.

Public uses of power energy: This refers to the amount of electricity that is used for public services.

Agricultural uses of power energy: This refers to the electricity that is used for pumping surface and underground water or repumping water for the production of crops or carrying out agricultural activities.

Industrial uses of power energy: This refers to the electricity that is used in establishments with manufacturing and mining activities.

Distribution grid of power: This refers to a set of distribution lines with different voltage lines (mainly 33 kV and lower) used for electricity distribution in an area or a locality.

Transmission and sub-transmission network: This refers to a series of substations, lines, cables, and other electrical equipment connected from power plants or high voltage substations to final consumers at a voltage of 63 kV and higher.

Electrical substation or power station: This refers to a site with a set of installations and electrical equipment including transformers, switches, sectionneur, measurement instruments, inflow and outflow lines, a reactor, a capacitor and different bays used for transmission and distribution of electricity.

Selected information

In the aquatic year 1398-1399, the amount of annual discharge of the underground water resources was about 65115 million cu m, which had a 3.9 percent increase in comparison with the aquatic year 1397-1398. It should be noted that out of 6 main basins, the central plateau with 49.9% had the maximum annual discharge.

In the year 1399, the inflow of the large reservoir dams amounted to 48366 million cu m which had a 39.7% decrease in comparison with the last year. In this year, 41254 million cu m of large reservoir dams has been consumed, 59.6 percent of which belong to the agricultural consumptions.

In the same year, over 8392 million cu m of water is produced in the water and sewage companies of the country (urban and rural) out of which about 5960 million cu/m was sold. Sale of water increased by 2.9 percent compared to the preceding year. This is while that the production of water grew by 6.7 percent compared to the previous year (the year 1398).

In the year 1399, there were over 23 million and 511 thousand urban and rural water extensions which had a 2.5 percent increase in comparison with the preceding year. Out of this number, over

17 million and 506 thousand extensions were in urban areas which had a 2.5% increase compared to the previous year.

In the year 1399, the gross electricity generation of institutions affiliated with the Ministry of Energy was 139068 million kilowatt-hours, of which about 43.1 percent has been produced in the steam power plants. Furthermore, the gross electricity generation amount had a 4.9 percent increase compared to the preceding year.

In this year, 290847 million kilowatt-hours of domestic sold electricity was consumed by 37 million and 617 thousand customers. In this respect, the amount of electricity sold and the number of electricity customers increased by about

5.7 and 2.7 percent respectively compared to the preceding year.

Among all electricity customers in the year 1399, the percentage of customers in the house, public, agricultural, and manufacturing sectors was 80.2, 4.8, 1.3, and 0.7 percent, respectively. Also in this year, the percentage of the sold electricity which was consumed in the house, manufacturing, agricultural, public sectors and for the streets lighting was 31.7, 37.2, 14.2, 8.5 and 1.7 percent respectively.

At the end of the year 1399, a number of 57755 villages (over 4.5 million rural households) were electrified which increased by 0.1% in comparison with the previous year.

Hamedan	139	153	0	153	65	10	42	0	13
Ekbatan ⁽²⁾	59	67	0	67	50	4	34	0	12
Abshineh ⁽²⁾	8	7	0	7	4	0	4	0	0
Shirinsu	2	4	0	4	0	0	0	0	0
Kalan-e-Malayer	46	49	0	49	4	3	0	0	1
Sarabi	13	14	0	14	6	3	3	0	0
Shanjur	11	13	0	13	1	1	0	0	0

1. The information refers to the 198 large reservoir dams (based on the ICOLD definition) with a capacity of 49.6 bln.cu.m, almost equaling over 95% of the total volume of the dams under use.
2. Total inflow and outflow are calculated through omission of the influence of being a chain of (Latian and Mamlo dams in Tehran Ostan), (Shahid Abbaspur, Karun3, Karun 4, Masjed-Soleyman and Gotvand-e-Olia dams in Khuzestan Ostan), (Dorudzan and Mollasadra in Fars Ostan), (Seymareh in Ilam Ostan and Karkheh in Khuzestan Ostan), (Golestan1, Golestan2, and Voshmgir in Golestan Ostan), (Chahehniyeh 1,2,3 and 4 in Sistan&Baluchestan Ostan), (Ekbatan and Abshineh in Hamedan Ostan), (Soleymanshah and Gavshan in Kermanshah Ostan) and (Aras and Khoda Afarin in East-Azarbayan Ostan). Moreover, inflow volume is calculated through a balance of volume changes in the reservoir and the amount of outflow.
3. The amount of water included for different consumption is the volume of water released for different consumption. With respect to the location of dams and the distance between them and consumption place, specially in agricultural sector, the water released for the agriculture is different from the volume of the water delivered to this sector. The difference is due to different reasons including middle basin, midway offtake, penetration, evaporation, etc.. Moreover, drinking water is the volume of water discharged from the dam.
4. Other outflows include evaporation, weir, dam take-out gates, slit ejection, direct pumping from reservoir, drainage and leaking. Moreover, difference between total and sum of parts is due to existence of some chain dams.
5. Other consumption includes the water at the time of stability of flow of the river.
6. Main difference between consumption (41.25 bln cu m) and net outflow (51.28 bln cu m) is related to the outflow of border dams for neighboring countries, evaporation from all dams, weirs, and other non-consumable outflows (Row 232).
- a. Aras, Bukan, Zayanderud, Taleghan, Karaj, Karkheh, Golpayegan, Gavshan and Kusar dams supply water both for mentioned Ostans in above table and other Ostans.
- b. Seymareh dam is located in Ilam Ostan and the Company for Development of Water Resources and Energy of Iran is responsible for this dam but due to its aquatic relationship with Karkheh dam, it is classified in Khuzestan Ostan.
- c. Kucher dam is located in Esfahan Ostan and Tehran Regional Company is responsible for this dam; however, due to supplying drinking water for Qom city accounting for the major consumption of the dam, the related statistics are included in Qom Ostan.
7. The outflow of the Aras dam and Dusti dam is equal to the total outflow of the dam, and consumptions only include I.R Iran consumption.
8. The net output of the turbine with the removal of successive dams is 30549 million cubic meters. (Row 233).
9. The consumption from the chain dams of Shahid Abbaspour, Karun 3, Karun 4, and Gotvand-e-Olya is included in the consumption of Gotvand-e-Olya dam.
10. Karun 4 reservoir dam is located in Chaharmahal & Bakhtiari Ostan. However, since it is located on the Karun river, it is included in Khuzestan Ostan.

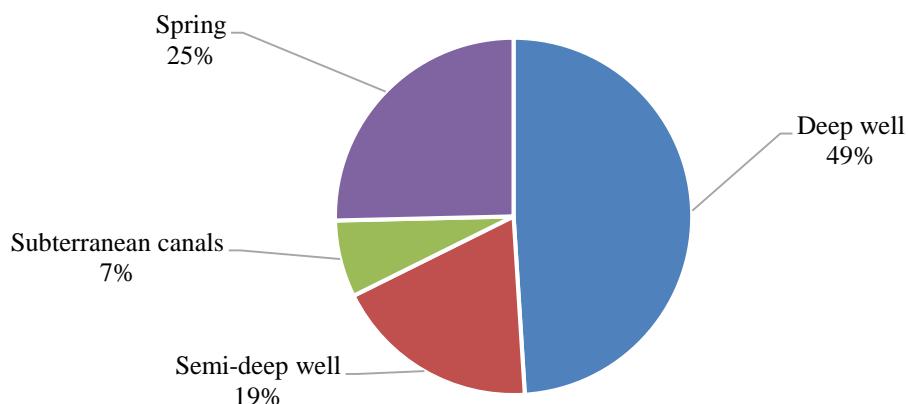

Source: Ministry of Energy.

9.1. ANNUAL DISCHARGE FROM UNDERGROUND WATER RESOURCES BY MAIN BASINS, THE ACQUATIC YEAR 1398-99

For data see Table 9.1.

9.2. PERCENTAGE OF ANNUAL DISCHARGE FROM UNDERGROUND WATER RESOURCES, THE YEAR 1398-99

For data see Table 9.1.
